

# ProctorIQ – Internship Deliverables Report

**Project:** Development of Smart Examination Monitoring platform with Integrity Analysis & Reporting System

## Deliverables prepared

| Deliverable    | Purpose                                                                     |
|----------------|-----------------------------------------------------------------------------|
| Agile Template | Product backlog, sprint backlog, stand-up and retrospective tracking.       |
| Defect Tracker | Defect description, sprint, classification, action, status and remarks.     |
| Unit Test Plan | Test procedure, conditions, expected result and actual result for 16 cases. |

## System scope

ProctorIQ combines MCQ assessment, pre-assessment camera validation, browser monitoring, face monitoring, integrity scoring, violation management, session analytics, K-Means clustering, risk profiling and AI-assisted integrity reporting.

## Agile summary

Eight user stories and ten sprint tasks are documented, with stand-up impediments/actions and two sprint retrospectives.

## Defect summary

Five issues are documented: camera-service regression, assessment white-screen/template rendering, local CSRF blocking, unused face-detection configuration constants, and Python dependency compatibility.

## Testing summary

Sixteen test cases cover camera validation, face conditions, assessment state, browser monitoring, integrity calculation, risk classification, analytics, K-Means, AI fallback and submission.

## Data analysis

Pandas is used for session analytics; Matplotlib/Seaborn support visualization; scikit-learn K-Means supports behavioral clustering; synthetic low/medium/high-risk sessions support validation.

## Conclusion

The three requested template-based deliverables provide traceability from user stories and sprint work through defects and testing, while documenting the data-analysis layer of ProctorIQ.
